# **Learning High-Order Word Representations**

Konstantinos Kogkalidis June 12, 2018

LoLa Fan Club

# Motivation

# **Distributional Compositional Semantics**

Idea: structure-preserving map  ${\mathcal F}$ 

$$\mathcal{F}:\mathcal{G} o extbf{FdVect}$$

- Atomic types translated to vectors (order-one tensors)
- Complex types translated to (multi-)linear maps (higher order tensors)

# **Example**

Word Type	$\mathcal{G}$ Type	${\cal F}$ Translation
Noun	NP	$\mathbb{R}^{NP}$
Adjective	NP/NP	$\mathbb{R}^{NP\times NP} \equiv \mathbb{R}^{NP} \to \mathbb{R}^{NP}$

$$\textit{cat} \in \mathbb{R}^\textit{NP}$$
 
$$\textit{black}, \ \textit{stray} \in \mathbb{R}^\textit{NP} \times \textit{NP}$$
 
$$\textit{black stray cat} \in \mathbb{R}^\textit{NP}$$

- · Bridging of formal & distributional semantics
- · Syntax-informed meaning derivations
- Modeling of functional words
- · Formal treatment of ambiguous derivations
- Contextual Disambiguation
- Richer representations

:

- √ Great properties

- ? How to obtain word representations?

#### Possible options:

1. Co-occurrence statistics

- √ Great properties
- ? How to obtain word representations?

#### Possible options:

- 1. Co-occurrence statistics X
- 2. Unsupervised techniques (a la word2vec)

- √ Great properties
- ? How to obtain word representations?

#### Possible options:

- 1. Co-occurrence statistics X
- 2. Unsupervised techniques (a la word2vec) X
- 3. Supervised learning?

#### **Problem Statement**

Examine whether supervised learning can be used to find higher-order word representations (transitive verbs)

**Supervised Learning** 

#### Overview

- Search over set of functions  $A \rightarrow B$  parameterized over P
- Find optimal approximation  $\hat{f}_P$  to  $f: A \to B$
- Use samples  $(a, f(a)) \in A \times B$  to update P

# Supervised Learning

Dataset

# **Finding Data**

#### Sample space must be:

- · labeled
- · constrained
- · of large size
- · of high quality

### **Paraphrase Database**

Raw text paraphrase pairs

#### **Example pair**

proposed by the president  $\sim$  suggested by the chairman

- labeled √
- constrained X (different syntactic types)
- of large size √
- · of high quality?

# **Dataset: Preprocessing**

- 1. **Parse and filter by type** (transitive verb case)
  - labeled √
  - constrained √
  - of large size ✗ (>95% loss)
  - of high quality X (parser-induced errors)

# Dataset: Preprocessing

#### 2. Back-translation

- Labeled ✓
- constrained √
- of large size √
- of high quality X (translation-induced errors)

# **Dataset: Preprocessing**

### 3. Filter by co-occurrence / mutual information

- Labeled ✓
- constrained √
- · of large size  $\checkmark$
- of high quality?

#### **Dataset: End Result**

Verb / object dictionaries:

$$V: \{v_1: 1, v_2: 2, ..., v_N: N\}$$
  
 $\mathcal{O}: \{o_1: 1, o_2: 2, ..., o_M: M\}$ 

Paraphrase relation:

$$\mathcal{P}: \mathbb{N} \times \mathbb{N} \times \mathbb{N} \times \mathbb{N} \to \{0,1\} \qquad \text{(binary classification)}$$

$$\mathcal{P}(i,j,k,l) = \mathcal{P}(k,l,i,j) = \begin{cases} 1 & v_i o_j \sim v_k o_l \\ 0 & \text{otherwise} \end{cases}$$

# **Supervised Learning**

Formulating the Network

# **Training Objective**

Our semantic interpretations are:

- Actions:  $[a] = \mathbb{R}^A$
- Objects:  $\lceil np \rceil = \mathbb{R}^{NP}$
- Transitive Verbs:  $\lceil a/np \rceil = \mathbb{R}^{A \times NP}$

And our objective is to learn a verb embedding function  $\varepsilon_{verb}$ :

$$\varepsilon_{\mathit{verb}}: \mathbb{N} \to \mathbb{R}^{\mathsf{A} \times \mathit{NP}}$$

But instead we have samples from some  $f: \mathbb{N}^4 \to \{0,1\}$ 

# **Intermediate Representations**

#### **Solution**

Formulate  $f_P$  to incorporate  $\varepsilon_{verb}$ .

$$f_p = f_1 \circ f_2 \circ \cdots \circ \varepsilon_{verb} \circ \ldots$$

# **Intermediate Representations**

#### **Solution**

Formulate  $f_P$  to incorporate  $\varepsilon_{verb}$ .

$$f_p = f_1 \circ f_2 \circ \cdots \circ \varepsilon_{verb} \circ \ldots$$

#### Simplification (1)

Assume pre-trained object embedding function  $\varepsilon_{object}$ .

$$\varepsilon_{object}: \mathbb{N} \to \mathbb{R}^{300}$$

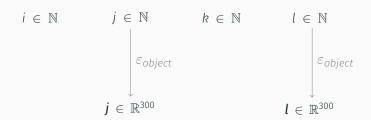

$$i \in \mathbb{N}$$
  $j \in \mathbb{N}$   $k \in \mathbb{N}$   $l \in \mathbb{N}$ 

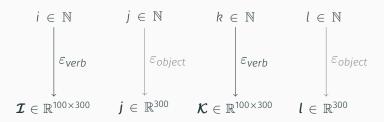

$$\in \mathbb{N}$$

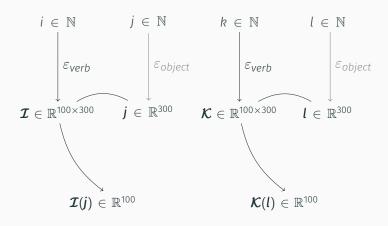

$$k \in \mathbb{N}$$

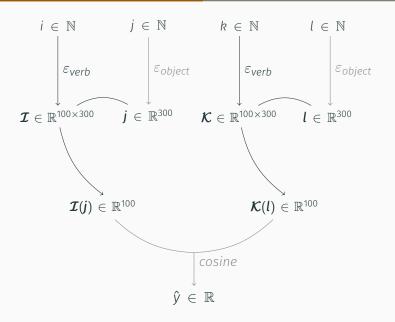

$$\in \mathbb{N}$$

$$\in \mathbb{R}$$

# **Objective Function**

$$cos(\textbf{V}_i(\textbf{j}),\textbf{V}_k(\textbf{l})) \rightsquigarrow \mathcal{P}(i,j,k,l) \quad \forall \ (i,j,k,l) \in \mathcal{V} \times \mathcal{O} \times \mathcal{V} \times \mathcal{O}$$

### **Objective Function**

$$cos(V_i(j), V_k(l)) \rightsquigarrow \mathcal{P}(i, j, k, l) \quad \forall \ (i, j, k, l) \in \mathcal{V} \times \mathcal{O} \times \mathcal{V} \times \mathcal{O}$$

#### Considerations:

- 1. Network Size
  - · 1.000 verbs
  - $100 \times 300 = 30.000$  parameters per verb
  - $\Rightarrow$  30.000.000 parameters for  $\varepsilon_{verb}$  to learn

# **Objective Function**

$$cos(V_i(j), V_k(l)) \rightsquigarrow \mathcal{P}(i, j, k, l) \quad \forall \ (i, j, k, l) \in \mathcal{V} \times \mathcal{O} \times \mathcal{V} \times \mathcal{O}$$

#### Considerations:

- 1. Network Size
  - · 1.000 verbs
  - $100 \times 300 = 30.000$  parameters per verb
  - $\Rightarrow$  30.000.000 parameters for  $\varepsilon_{verb}$  to learn
- 2. Quantifying over two spaces ...

### **Objective Function**

$$cos(V_i(j), V_k(l)) \rightsquigarrow \mathcal{P}(i, j, k, l) \quad \forall \ (i, j, k, l) \in \mathcal{V} \times \mathcal{O} \times \mathcal{V} \times \mathcal{O}$$

#### Considerations:

- 1. Network Size
  - · 1.000 verbs
  - $100 \times 300 = 30.000$  parameters per verb
  - $\Rightarrow$  30.000.000 parameters for  $\varepsilon_{verb}$  to learn
- 2. Quantifying over two spaces ...
- 3. ... both of which are non-convex

... A "beast" to train 😊

# **Supervised Learning**

**Transferring Knowledge** 

# Finding an Oracle

Dataception: use our labeled dataset to create a new dataset

# **Finding an Oracle**

Dataception: use our labeled dataset to create a new dataset

### Simplification (2)

Assume another pre-trained verb embedding function  $\varepsilon'_{verb}$ .

$$\varepsilon'_{\mathit{verb}}: \mathbb{N} \to \mathbb{R}^{300}$$

# **Finding an Oracle**

Dataception: use our labeled dataset to create a new dataset

### Simplification (2)

Assume another pre-trained verb embedding function  $\varepsilon'_{verb}$ .

$$\varepsilon'_{\mathit{verb}}: \mathbb{N} \to \mathbb{R}^{300}$$

#### Oracle

We can now train a paraphrase embedding function  $\varepsilon_{par}$ .

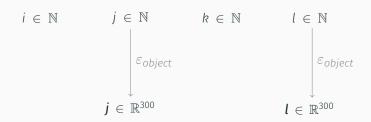

$$\varepsilon_{par}: \mathbb{R}^{300} \times \mathbb{R}^{300} \to \mathbb{R}^{100}$$

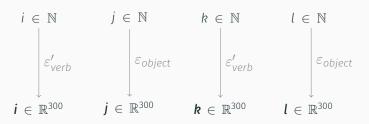

$$i \in \mathbb{N}$$
  $j \in \mathbb{N}$   $k \in \mathbb{N}$   $l \in \mathbb{N}$ 

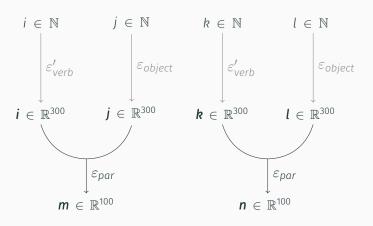

$$j \in \mathbb{N}$$

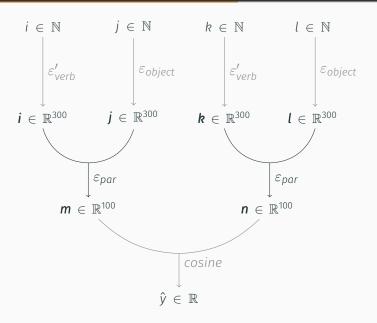

$$k \in \mathbb{N}$$

$$\in \mathbb{N}$$

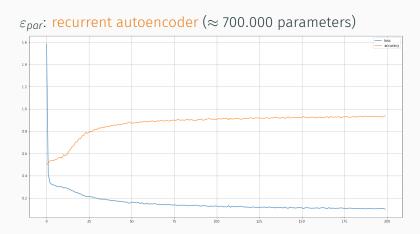

# **Training the Oracle**

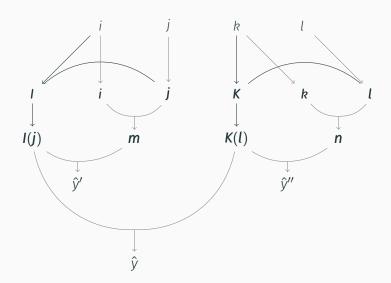

# **Utilizing the Oracle**

#### **New Objective Function**

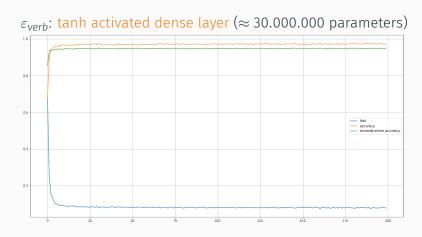

$$cos(V_i(j), \varepsilon_{par}(v_i, j)) \rightsquigarrow 1 \quad \forall (i, j) \in \mathcal{V} \times \mathcal{O}$$

- $\cdot$   $\varepsilon_{par}$  gives us paraphrase embeddings 'for free'
- · We can use them to facilitate training
- Much smaller problem space

# **Composing Networks**

# **Training the Original**

The beast has been tamed! ©

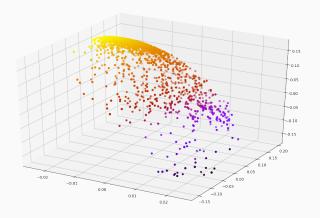

#### **Microstructure**

Task-specific performance relates to the small-scale structure of the learned space:

	Prediction	Oracle		Final	
Ground Truth		Т	$\perp$	Т	
Т		0.92	0.08	0.88	0.02
$\perp$		0.08	0.92	0.12	0.98

#### Macrostructure

## 3D PCA on paraphrase embeddings

# Conclusion

# Critique

- 1. Metric reliability
- 2. Uninformative error signal
- 3. Over-parameterization
  - a) Linearity constraint
  - b) Chasing after an oracle
  - c) Bad scaling

#### **Next Steps**

- 1. Directly evaluate verb matrices
- 2. More structural constraints (activity regularization)
- 3. Iterative learning
- 4. Other data formats:
  - Different syntactic types
  - Different labels / samples altogether
- 5. Different oracle architectures
- 6. Different embedder architectures (encoder/decoder)

**Bag of Tricks** 

# **Negative Sampling**

Let  $L : \mathbb{R} \times \mathbb{R} \to \mathbb{R}$  be the loss function.

Objective translates to:

$$\min_{P} L[\mathcal{P}(i,j,k,l), \hat{y}_{P}] \quad \forall (i,j,k,l)$$
 (Intractable)

Randomly generate and select negative samples (different every epoch).

# **Curriculum Learning**

"Two phrases are not similar unless they are"

- Class imbalance ⇒ bad predictions
- Treat negative samples as noise
- · Learn positive examples then increase noise

# **Loss Mixing**

Cross-entropy vs. MSE vs. Categorical Hinge

- · Different assumptions, none correct.
- Many falsities  $\Rightarrow$  Truth ?
